PHASE 6 – PROJECT TESTING

1. Purpose of Testing

Testing is an important phase of the project development process. The main purpose of testing is to verify and validate whether the developed system works according to the specified requirements. Testing helps to identify errors, missing functionalities, incorrect inputs, workflow problems, and access-related issues before the system is used by actual users.

The laptop request management system is tested to ensure that users can successfully submit laptop requests, enter valid employee information, select the required laptop type, and view their request details. The system is also tested to ensure that incomplete or invalid information is properly handled through validation messages.

Testing is performed on different parts of the system, including request submission, employee details, laptop selection, request viewing, request status updating, validation, user interface, workflow processing, and access control. Each function is checked against its expected result.

The testing process also ensures that the request follows the correct standard laptop ordering workflow. Any errors identified during testing are corrected, and the affected functionality is tested again to confirm that the issue has been successfully resolved.

2. Test Cases

S.No	Test Case	Test Condition / Action	Expected Result
1	Submit valid laptop request	Enter all required employee and laptop request details correctly and submit the request.	The system should successfully create the laptop request and displ
2	Submit incomplete request	Leave one or more mandatory fields empty and attempt to submit the request.	The system should prevent submission and display an appropriate
3	Enter valid employee details	Enter valid employee name, ID, department, contact details, and other required information.	The system should accept the employee details and allow the user
4	Enter invalid employee details	Enter incorrect, incomplete, or invalid employee information.	The system should identify the invalid information and display a suit
5	Standard laptop selecte	Select the standard laptop option and submit the request.	The request should follow the predefined standard laptop ordering
6	View submitted request	Open the request details after successfully submitting a request.	The system should display the submitted request information correc
7	Update request status	Change the status of an existing request from the authorized user section.	The new request status should be saved and displayed correctly.
8	Unauthorized access	Attempt to access restricted pages or functions without proper authorization.	The system should restrict access and prevent unauthorized users
9	Request validation	Submit the request with incorrect or missing required information.	The system should validate the entered information and prevent inv
10	Request workflow	Submit a standard laptop request and follow the complete request process.	The request should move through the correct workflow stages witho
11	Request data display	Open an existing request from the request list.	All relevant request information should be displayed accurately and
12	Multiple requests	Submit more than one valid laptop request when permitted.	Each request should be stored separately and displayed with the co

3. Testing Types

3.1 Functional Testing

Functional testing verifies whether each function of the laptop request management system works according to the defined requirements. Employee information entry, laptop selection, request submission, request creation, request viewing, status updating, validation, and workflow processing are tested using different inputs.

3.2 User Interface Testing

User Interface Testing verifies whether the system interface is simple, clear, consistent, and easy to use. Screens, forms, buttons, menus, input fields, request details, and status information are checked for clarity and usability.

3.3 Validation Testing

Validation testing checks whether the system correctly handles incorrect, incomplete, or invalid information. Mandatory fields are tested by leaving them empty, while invalid values and incomplete employee details are also tested. The system should prevent incorrect information from being submitted and should display suitable validation messages.

3.4 Workflow Testing

Workflow testing verifies whether a laptop request moves through the correct sequence of processes. The complete process from employee details and laptop selection to request submission, creation, viewing, and status updating is tested to ensure that each stage works correctly.

3.5 Access Control Testing

Access control testing verifies that only authorized users can access restricted functions and information. Unauthorized attempts to open protected pages or modify restricted information are tested to ensure that access is denied.

3.6 Data Testing

Data testing verifies whether information entered by users is correctly stored, retrieved, and displayed. Submitted employee details, laptop selection, and request status are compared with the original input to ensure that no information is lost or incorrectly changed.

4. Testing Procedure

The testing process is carried out systematically to verify the complete functionality of the system. First, valid employee details are entered into the request form. The required laptop option is selected and the request is submitted. The system response is checked to ensure that the request is created successfully.

Next, incomplete and invalid information is entered intentionally to test validation. The system is expected to identify the errors and prevent incorrect information from being submitted.

After a request is created, the request details are opened and verified against the information originally entered. The request status update functionality is then tested by an authorized user, and the system is checked to ensure that the updated status is saved and displayed correctly.

Finally, unauthorized access is tested by attempting to open restricted sections without the required authorization. The system should deny access and protect restricted information.

CheckBox	Adobe Acrobat	20
CheckBox	Adobe Photoshop	30

5. Testing Result

The testing process was successfully carried out on the major functionalities of the laptop request management system. Valid requests were successfully submitted and stored, while incomplete and invalid requests were handled through appropriate validation mechanisms.

The employee details were checked to ensure that valid information was accepted correctly. The standard laptop selection was also tested to confirm that the request followed the defined standard ordering workflow.

The request viewing functionality was verified to ensure that users could view submitted request details accurately. Request status updating was also tested to confirm that changes were properly reflected in the system.

Access control testing confirmed that restricted functions and information were protected from unauthorized access.

During testing, errors and unexpected behaviours identified in the system were corrected. After making the required corrections, the affected functions were tested again to verify that the issues had been resolved.

Overall, the testing process confirmed that the major components of the system operate according to the specified requirements. The standard laptop ordering workflow was successfully verified from request creation through request processing and status updates.

6. Final Testing Summary

The project testing phase ensured that the developed laptop request management system was functional, reliable, and suitable for its intended workflow.

The major functions including employee detail entry, laptop selection, request submission, request viewing, request status updating, validation, workflow processing, and access control were tested.

The system successfully handled valid requests and appropriately rejected incomplete or invalid information. The workflow was verified to ensure that requests progressed through the required stages correctly.

The errors identified during testing were corrected and retested. The final testing results indicate that the system performs its required operations correctly and that the standard laptop ordering workflow operates as intended.
