PHASE 5 – PROJECT DEVELOPMENT

1. Development Overview

During this phase, the designed system is implemented as a working application. The requirements and design prepared in the earlier phases are converted into actual application components, forms, fields, workflows, automation rules, status management, and user access controls. The main purpose of development is to create an organized standard laptop request process that can be used by employees and the responsible IT or procurement team.

The development work focuses on making the request process simple, controlled, and easy to track. Every major component is configured according to the project requirements. After configuration, the complete request lifecycle is tested to verify that the system behaves correctly from request submission to order completion.

2. Development Objectives

- Implement the system design as a functional application.
- Create a simple laptop request form for employees.
- Configure all necessary and mandatory fields.
- Implement a structured workflow for request processing.
- Maintain standard laptop information for identifying the required device.
- Automate repetitive processing activities where possible.
- Provide clear request status information at every stage.
- Configure user access according to user responsibilities.
- Test the complete workflow and verify that the system works correctly.

3. Development Activities

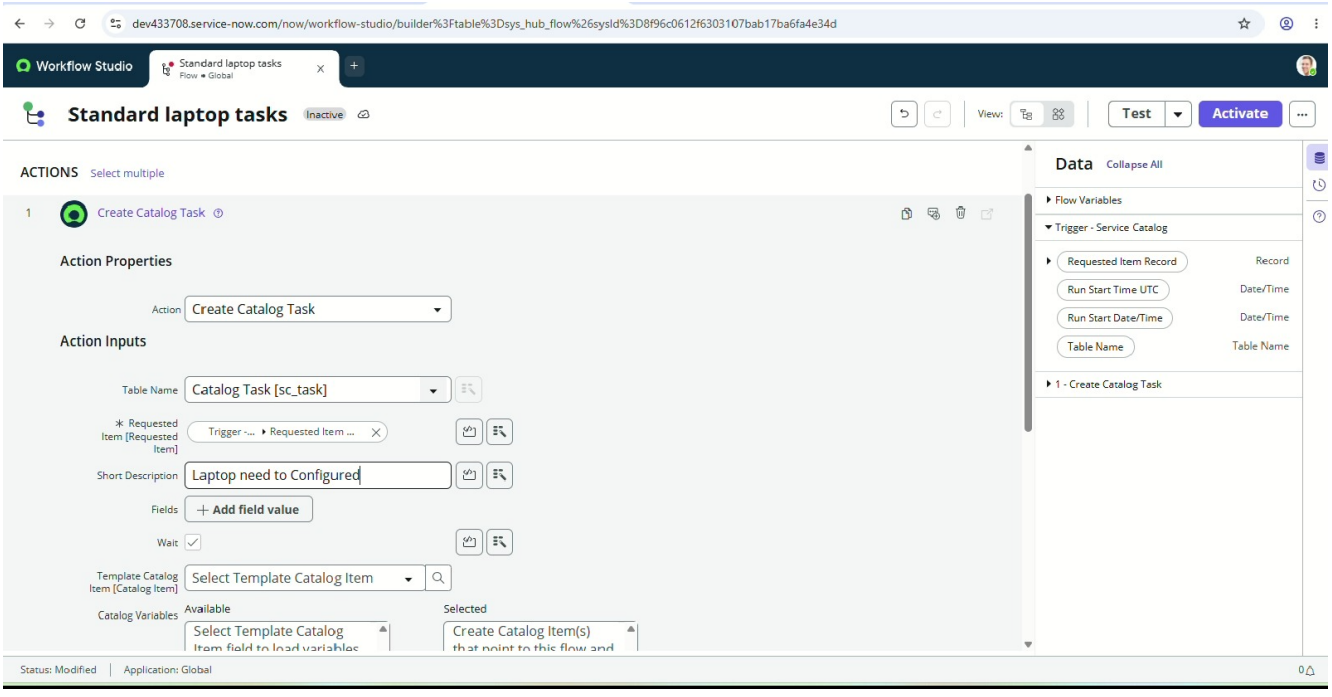

No.	Activity	Detailed Description
1	Create required application components	Create the application structure and components required for the laptop request system. These components support request submission, processing, tracking, and completion.
2	Create laptop request form	Develop the main request form through which employees enter the details required for a laptop request.
3	Configure required fields	Configure fields such as employee details, department, laptop requirement, justification, request date, and other required information. Mandatory fields help prevent incomplete submissions.
4	Configure request workflow	Configure the sequence through which a request moves from submission and validation to processing and completion.
5	Configure standard laptop information	Maintain information about standard laptops such as model, category, specifications, and other relevant details used during request processing.
6	Implement automated processing	Configure automation for activities such as routing requests, updating status, triggering notifications, and moving requests to the next stage.

No.	Activity	Detailed Description
7	Configure request status	Create status values that clearly indicate the current stage of each request and allow users to track progress.
8	Configure user access	Provide employees and authorized IT/procurement users with access appropriate to their responsibilities.
9	Test the complete workflow	Test the complete process from form submission to order completion and verify fields, workflow, automation, status updates, and permissions.

4. Laptop Request Form

The laptop request form is the primary interface used by an employee to submit a laptop requirement. The form collects the information necessary for validation and processing. It is designed to be clear and easy to use so that employees can provide the required details without confusion.

- Employee Name – identifies the person submitting the request.
- Employee ID – provides a unique employee reference.
- Department – identifies the employee department.
- Laptop Requirement – describes the laptop requirement.
- Business Justification – records the reason for requesting the laptop.
- Request Date – records the date of submission.
- Request Status – displays the current stage of the request.

5. Request Process

Submit Request

Process Request

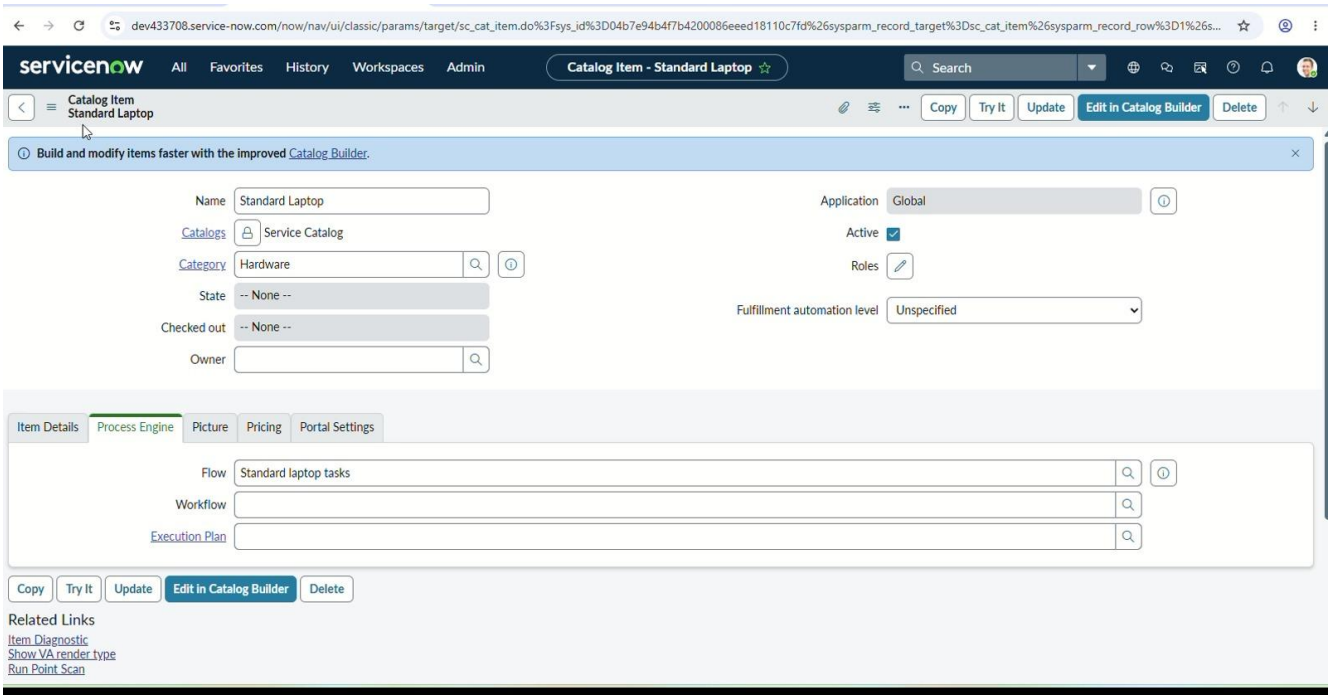

↓

Update Status

↓

Complete Order

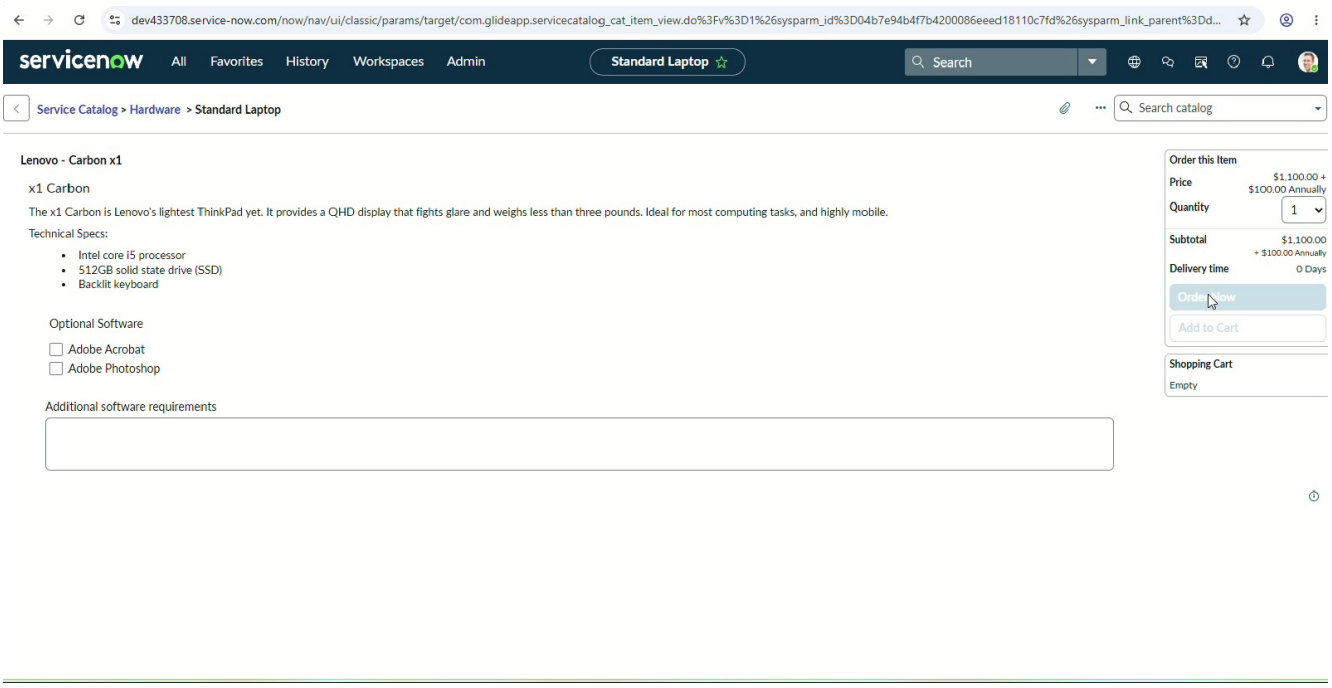

The request process begins when an employee submits the laptop request form. The submitted information is then validated to make sure that the necessary details are available. After validation, the appropriate standard laptop information is identified. The authorized team processes the request, the status is updated during each stage, and the process ends when the order is completed.

6. Request Status Management

Request status management helps users understand the current position of a laptop request. The status is changed as the request moves through the configured workflow.

- Submitted – the employee has successfully submitted the request.
- Under Validation – the request details are being checked.
- Processing – the request is being handled by the responsible team.
- Order in Progress – the laptop order is being processed.
- Completed – the request and order process have been completed.

7. Standard Laptop Information

Standard laptop information is configured so that the system can identify the laptop that matches the organization's standard requirement. The information can include laptop model, processor, memory, storage, operating system, category, and availability. Maintaining this information in an organized manner helps the responsible team process requests consistently.

8. Automated Processing

Automation is used to reduce repetitive manual work. Depending on the configured rules, the system can automatically update request status, route requests to the appropriate team, generate notifications, and move the request to the next workflow stage. Automation helps improve consistency and reduces delays caused by manual processing.

9. User Access Configuration

User access is configured according to the responsibilities of different users. Employees are provided access to create and view their laptop requests. Authorized IT or procurement users are provided access to validate, process, and update requests. Restricting sensitive actions to authorized users helps protect request information and prevents unauthorized changes.

10. Development Testing

- Verify that the laptop request form opens correctly.
- Check that all required fields accept valid information.
- Check that incomplete requests are handled correctly.

• Verify that the request workflow follows the correct sequence.

• Verify that standard laptop information is available for processing.

• Check automatic status changes and notifications.

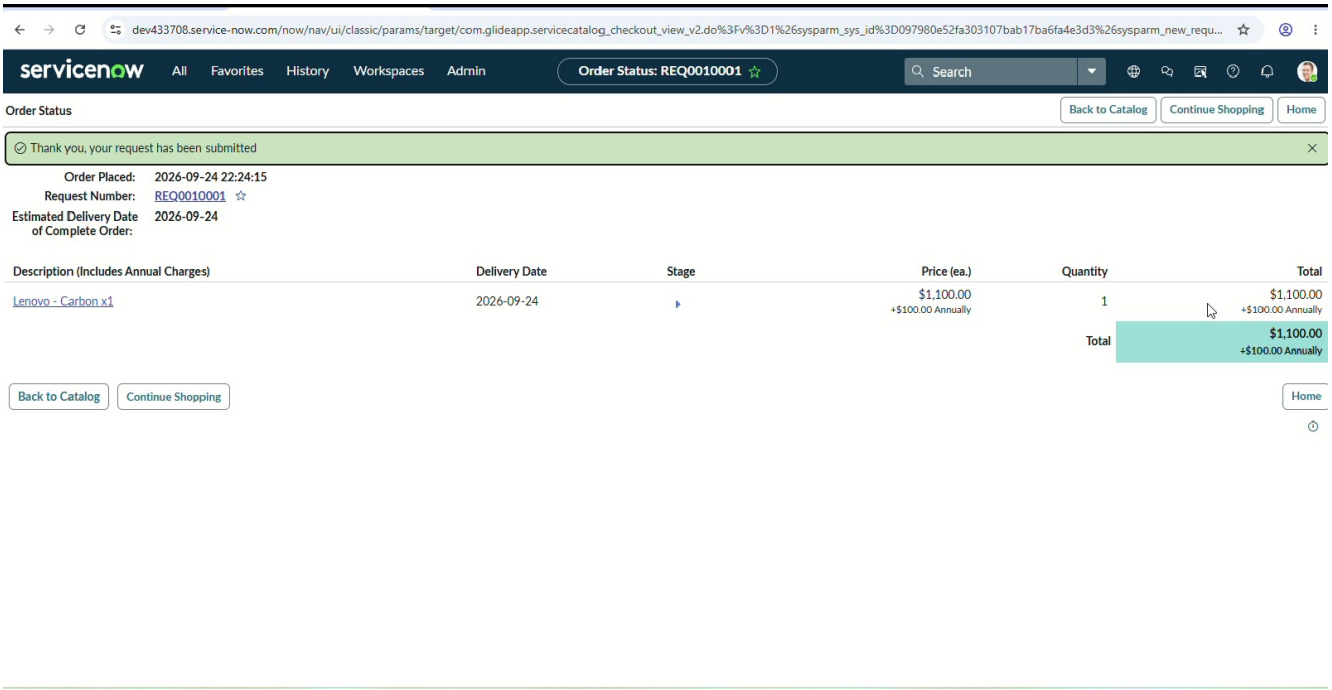

• Verify that employees can track their requests.

• Verify that restricted actions are available only to authorized users.

• Test the complete process from submission through completion.

11. Development Result

The development phase provides a structured system for submitting and processing standard laptop requests. The system combines the request form, required fields, standard laptop information, workflow, automation, status management, and user access controls into one organized process.

The completed system allows employees to submit requests and track their progress, while authorized IT or procurement users can validate and process those requests. The development result provides a clear request lifecycle from submission to order completion and prepares the system for detailed testing in the next phase.

12. Phase Summary

In Phase 5, the project design is converted into a functional application. The main development activities include creating application components, developing the laptop request form, configuring fields and workflow, maintaining standard laptop information, implementing automation, managing request status, configuring user access, and testing the complete workflow. These activities establish the functional foundation of the standard laptop request management system.
