PHASE 7 – PROJECT DOCUMENTATION

1. Project Overview

Project Name: Streamlining IT Procurement: Automating Standard Laptop Orders

The project, titled **"Streamlining IT Procurement: Automating Standard Laptop Orders"**, is developed to provide a structured and efficient approach for managing standard laptop procurement requests within an organization. The system provides a digital platform through which employees can submit laptop requests, provide the required information, and track the progress of their requests.

The project replaces a largely manual request-handling approach with a systematic workflow. Instead of depending on repeated manual communication, paperwork, or unstructured request handling, the system organizes employee details, laptop requirements, request information, validation, processing, and status management in a centralized manner.

The documentation phase records the purpose, functionality, workflow, benefits, and important outputs of the developed system. It also provides a clear reference for users, IT personnel, procurement teams, administrators, and future developers who may maintain or enhance the application.

2. Project Purpose

The main purpose of the project is to automate and simplify the standard laptop procurement process within an organization. The system is designed to make laptop request submission easier for employees while providing IT and procurement teams with a structured method for reviewing and processing requests.

The system allows users to enter the required employee information and submit a laptop request through a defined process. Request information can then be validated, processed, tracked, and updated according to the organization's standard workflow.

By introducing automation into the process, the project aims to reduce unnecessary manual activities, improve information accuracy, provide better visibility of request progress, and establish a consistent approach for handling standard laptop orders.

3. Problem Solved

Traditional laptop procurement processes may involve manual forms, emails, spreadsheets, repeated communication, and separate tracking methods. Such approaches can make it difficult to maintain consistent information and determine the current status of a request.

The developed system addresses these problems by providing a centralized and structured request-management process. Employees can submit requests using a defined form, while the system can validate the entered information and maintain the request details in an organized manner.

The system also provides request tracking and status management so that the progress of a request can be monitored. This reduces dependency on manual processing and provides a clearer workflow between employees, IT teams, and procurement teams.

Therefore, the project solves the problem of unstructured and time-consuming laptop request handling by introducing a systematic digital workflow for standard laptop orders.

4. Major Features

Feature	Description
Laptop Request Submission	Allows employees or authorized users to submit a standard laptop request by entering the required employee and request details.
Request Validation	Checks whether mandatory information is provided correctly before the request is submitted or processed.
Standard Laptop Identification	Identifies the standard laptop option and ensures that the request follows the defined standard procurement process.
Automated Processing	Supports a structured workflow so that submitted requests can move through the required processing stages without unnecessary manual handling.
Request Tracking	Allows users and authorized personnel to view request information and monitor the progress of submitted requests.
Status Management	Provides a mechanism for updating and displaying the current status of a laptop request.
IT Team Management	Provides IT personnel with access to request information required for reviewing and managing laptop requirements.
Procurement Management	Supports procurement-related processing by maintaining organized request information and helping the responsible team manage standard laptop orders.

5. Benefits

Benefit	Explanation
Saves Time	Automating the request process reduces the time required to collect, verify, and process standard laptop requests.
Reduces Manual Work	The system reduces dependency on manual forms, repeated data entry, and manual request tracking.
Reduces Errors	Validation and structured data entry help reduce incomplete, inconsistent, or incorrect request information.
Improves Efficiency	A defined workflow helps IT and procurement teams process requests in a more organized manner.
Provides Better Tracking	Users and authorized teams can view request details and monitor the current status of requests.
Standardizes Laptop Procurement	The system provides a consistent method for handling standard laptop orders according to the defined workflow.
Improves User Experience	A clear digital request process makes it easier for users to submit and monitor their laptop requests.

6. System Workflow Documentation

The system follows a structured workflow for handling standard laptop requests. The workflow begins when the user accesses the application and provides the required login information. After successful access, the user can navigate to the laptop request section and enter the required employee and request details.

The entered information is validated before the request is submitted. Once the request passes validation, it is created and made available for further processing. Authorized IT or procurement personnel can review the request, manage the request status, and continue the required procurement workflow.

The user can then view the request details and monitor the status of the request. This provides visibility throughout the request lifecycle and helps ensure that the standard laptop ordering process is handled systematically.

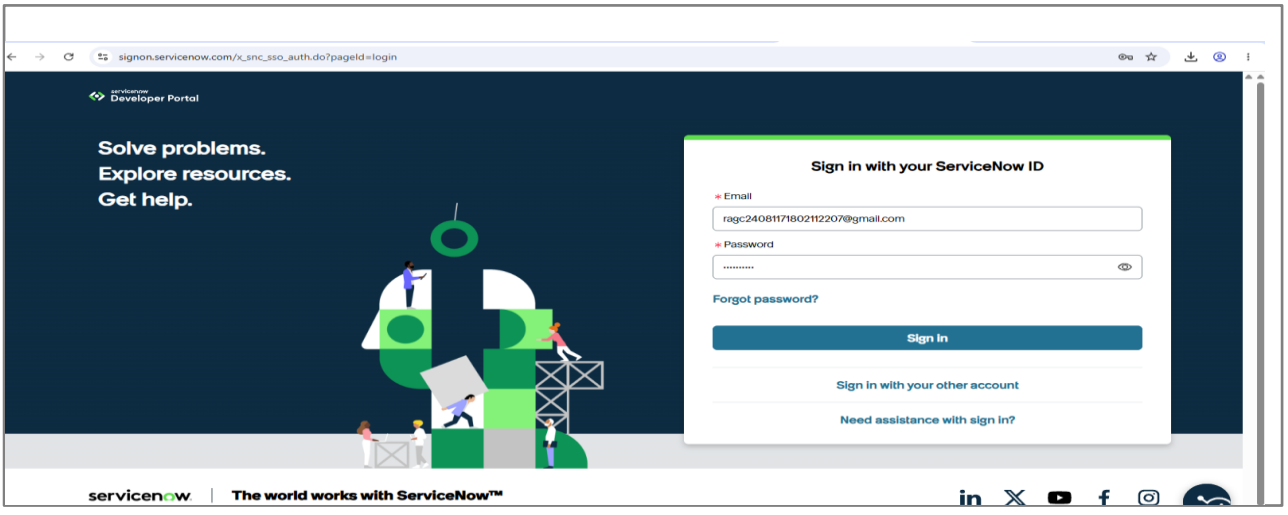

Step	Stage	Description
1	Login	User accesses the system using valid credentials.
2	Main Page	User navigates to the laptop request functionality.
3	Request Form	User enters employee and laptop request information.
4	Validation	System checks required fields and entered information.
5	Request Submission	Valid request is created and stored.
6	Request Processing	Authorized IT/procurement personnel review the request.
7	Status Management	Request status is updated according to its progress.
8	Request Tracking	User views the request and its current status.

7. Screenshots and System Evidence

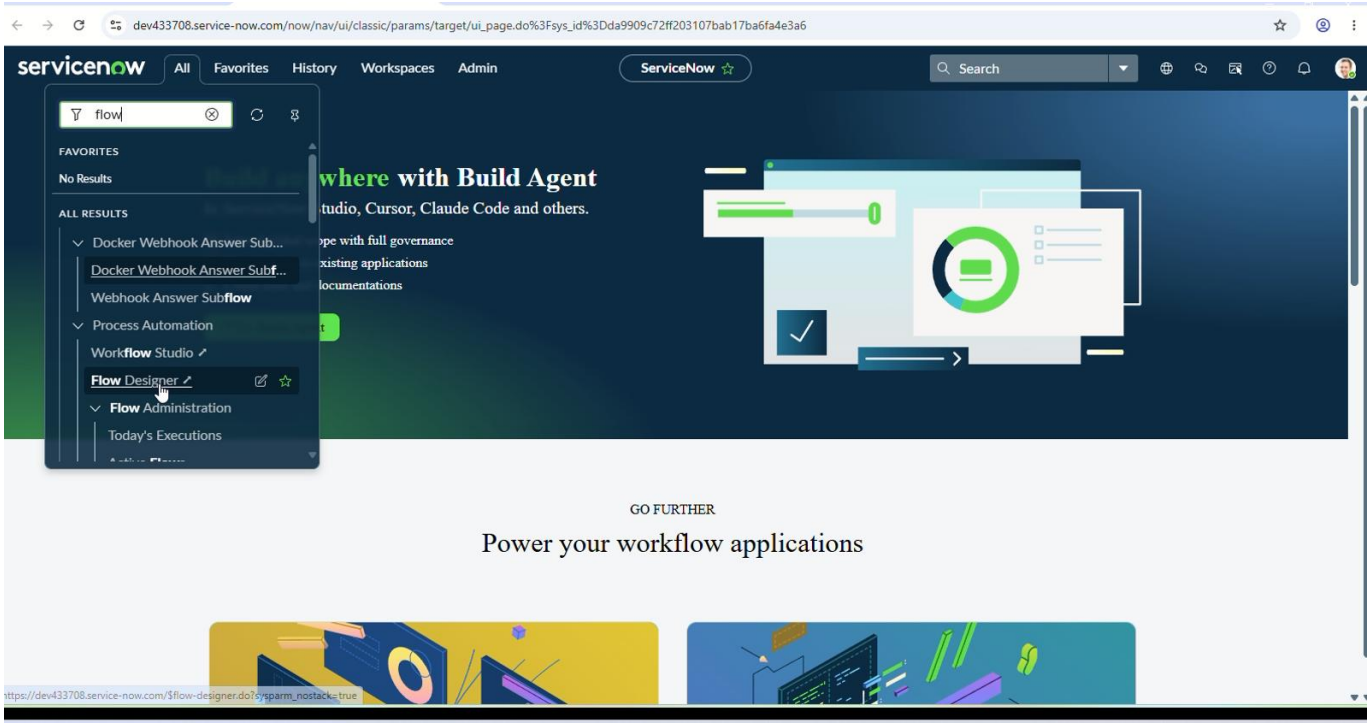

Screenshots are an important part of project documentation because they provide visual evidence that the developed system has been implemented and tested. The screenshots included in this section should be captured directly from the actual project application.

Each screenshot should clearly show the relevant page, feature, form, result, or workflow stage. Screenshots should be readable and should preferably include the complete application window or the important section of the page. Avoid adding unrelated screens or screenshots that do not demonstrate the project functionality.

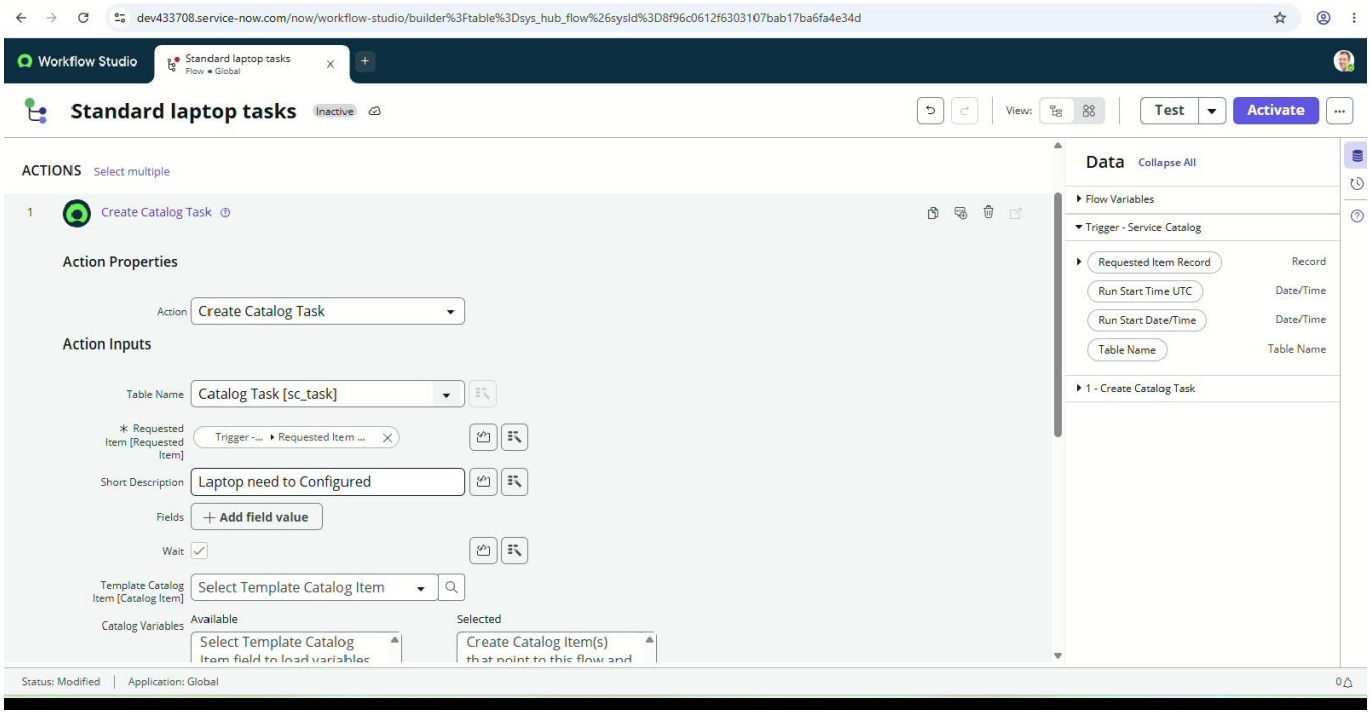

Screenshot 1 – Login Page

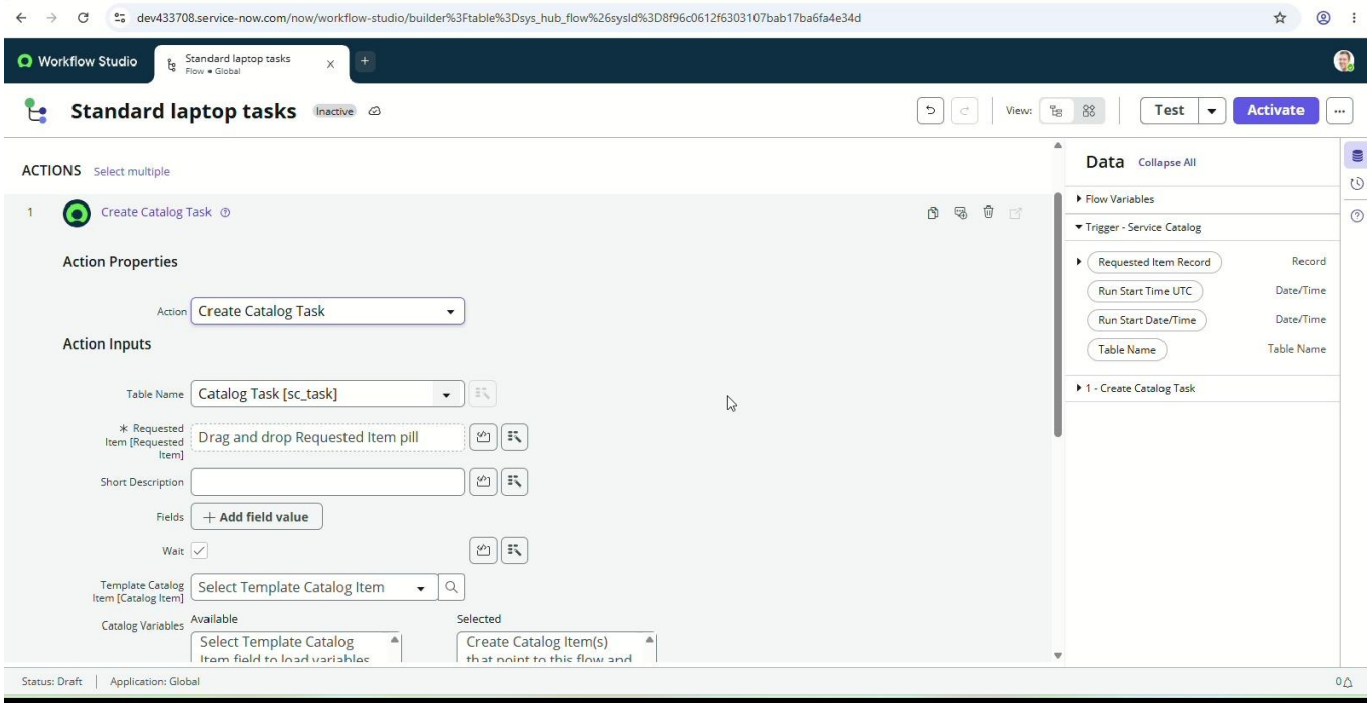

Screenshot 2 – Main Page / Dashboard

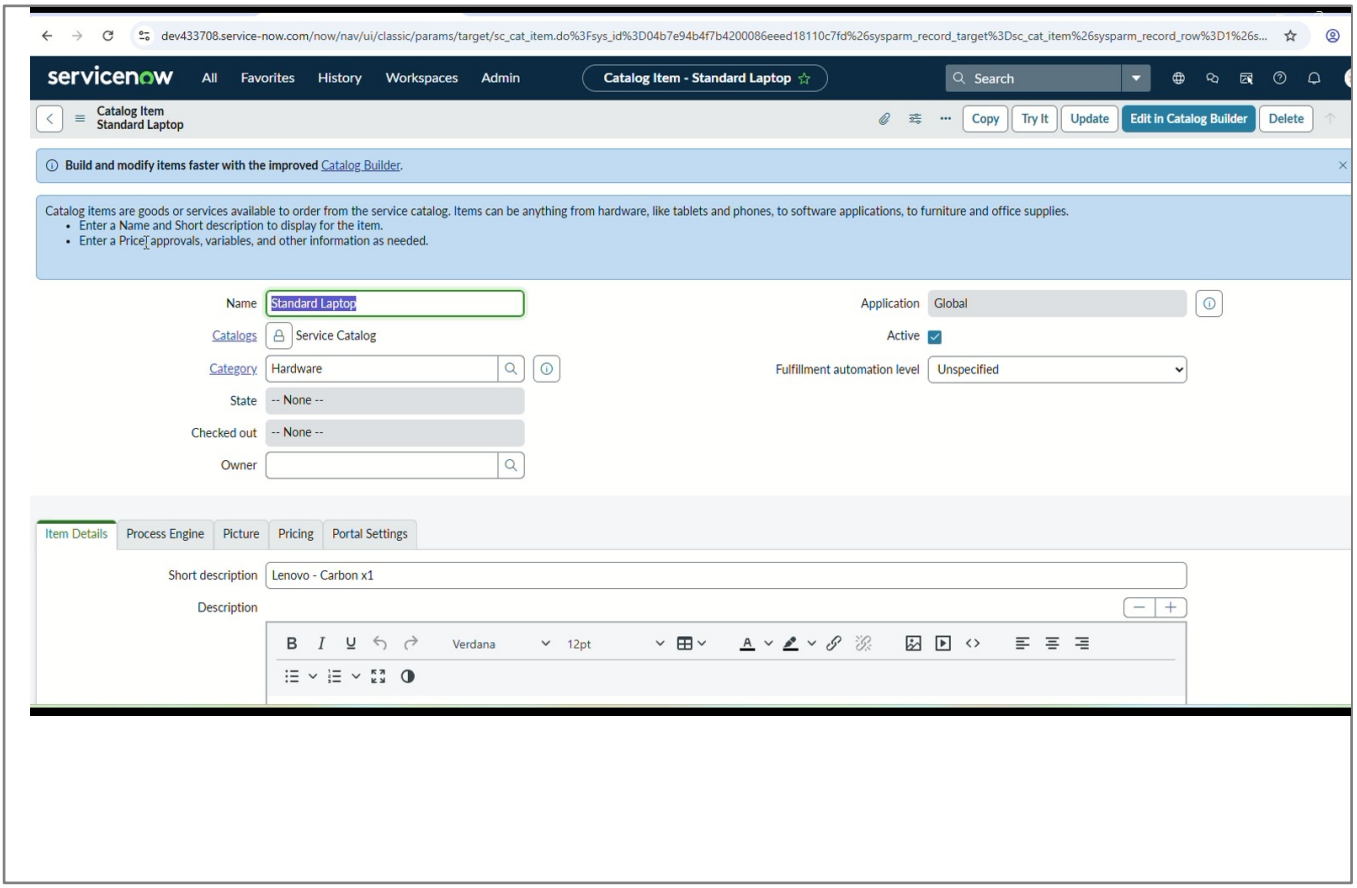

Screenshot 3 – Laptop Request Page

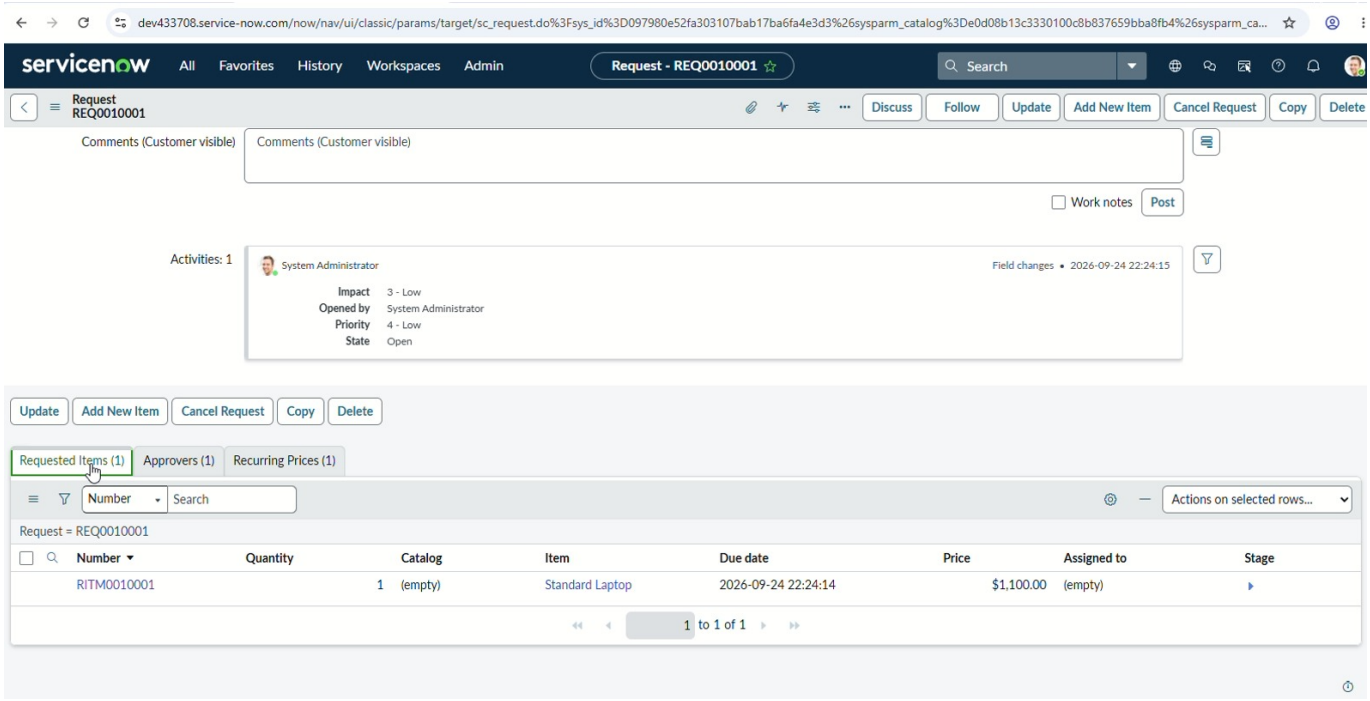

Screenshot 3 – Laptop Request Page

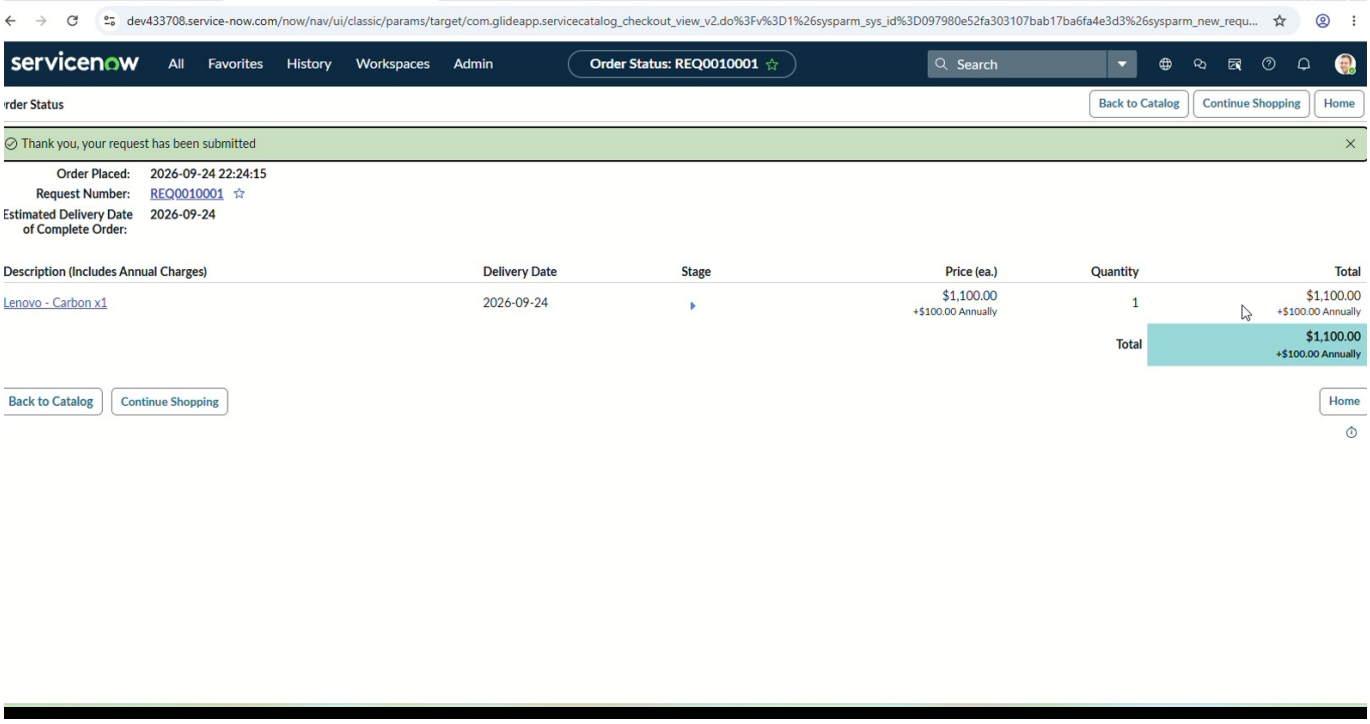

Screenshot 4 – Request Form

Screenshot 5 – Submitted Request

Screenshot 8 – Final Output

8. Documentation Guidelines for Screenshots

1. Capture screenshots directly from the actual developed project rather than using sample or unrelated images.

2. Make sure the project name, page title, form fields, buttons, request information, or status information that demonstrates the feature is visible.

3. Use clear and readable screenshots with sufficient resolution so that the text can be understood in the final report.

4. Place screenshots in the same order as the project workflow: Login → Main Page → Request Page → Request Form → Submitted Request → Request Status → Admin/IT View → Final Output.

5. Add a short caption below every screenshot explaining what the screenshot demonstrates.

6. Do not include unnecessary personal information, passwords, confidential credentials, or unrelated browser content in the screenshots.

7. Use screenshots from the final corrected version of the project so that the documentation matches the final system.

9. Overall Project Documentation Summary

The project documentation provides a complete overview of the “Streamlining IT Procurement: Automating Standard Laptop Orders” system. It explains the purpose of the project, the problem addressed, major system features, benefits, workflow, and visual evidence of implementation.

The documentation demonstrates how the system provides a structured method for submitting, validating, processing, tracking, and managing standard laptop requests. It also explains how the system supports employees, IT teams, and procurement personnel by organizing the request process into defined stages.

The screenshots included from the actual project provide visual confirmation of the implemented functionalities and final output. Together, the written explanation and screenshots form a clear record of the developed system and its overall operation.

10. Final Conclusion

The project successfully provides a digital and structured approach to standard laptop procurement. By replacing unorganized manual processing with a defined request workflow, the system supports efficient request submission, validation, processing, tracking, and status management.

The project documentation records the important aspects of the system and provides a reference for understanding its functionality and workflow. The inclusion of actual project screenshots further demonstrates the implementation and final output of the application.

Overall, the documented system provides a consistent and organized method for managing standard laptop orders and supports improved efficiency, accuracy, transparency, and user experience within the procurement process.
